

# All Good Adventure Architecture

---

## Goal

Convert the current static HTML prototype into a production-ready booking platform with:

- A customer-facing frontend
- A Laravel backend API
- Filament as the admin panel
- PostgreSQL as the database

The current HTML design should become the visual reference for the frontend pages and booking flow.

---

## Recommended Stack

### Frontend

Use one of these:

- React + Vite
- Next.js
- Vue / Nuxt
- Laravel Inertia + React

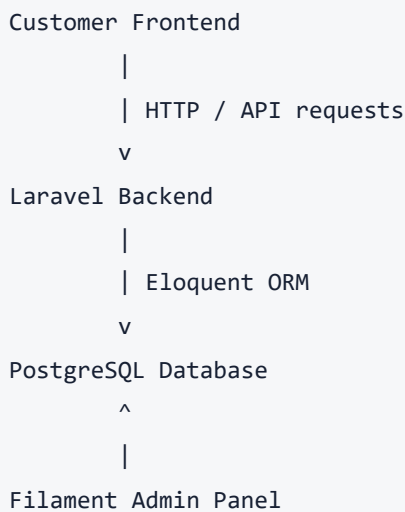

Recommended option for fastest full-stack development:

Laravel + Inertia + React + Filament + PostgreSQL

Recommended option for cleaner frontend/backend separation:

React or Next.js frontend  
Laravel API backend  
Filament admin panel  
PostgreSQL database

## High-Level Architecture

## Main Applications

### Customer Frontend

The frontend contains the public website and customer booking experience.

Pages:

- Home / Beranda
- Catalog / Katalog
- Destination detail
- Booking flow
- Tour guide list
- Tour guide detail
- About / Tentang
- Login
- Register
- OTP verification
- Profile
- Booking history

### Laravel Backend

The backend owns the business logic and database access.

Responsibilities:

- Authentication
- Destination data
- Tour guide data

- Booking submission
- Booking status management
- User profile data
- Price calculation
- Notifications later, such as WhatsApp or email

## **Filament Admin Panel**

Filament is used by internal staff/admin.

Admin can manage:

- Destinations
- Trip types
- Tour guides
- Bookings
- Customers/users
- Testimonials
- Gallery images
- Categories
- Admin roles and permissions

# Main Business Rules

## Trip Types

### One Day Trip

- Customer chooses one destination
- Customer chooses one guide
- Customer selects one departure date
- Duration is fixed to 1 day
- Price is calculated directly

### Rinjani Trip

- Destination is fixed to Pendakian Rinjani
- Customer chooses one guide
- Customer selects one departure date
- Return date is automatically departure date + 2 days
- Duration is fixed to 3 days 2 nights
- Price is calculated directly

### Custom Trip

- Customer can choose multiple destinations
- Customer chooses one guide
- Customer enters estimated duration
- Customer selects estimated departure date
- Price is confirmed manually by admin

## Guide Pricing

Tour guide cost is included in the destination/trip price.

Do not calculate guide as a separate cost.

Guide price = included

Additional guide fee = 0

## Price Calculation

One Day Trip:

```
total = destination.price * participants_count
```

Rinjani Trip:

```
total = rinjani.price * participants_count
```

Custom Trip:

```
total = null
```

admin confirms final price later

---

## Booking Flow

Step 1: Choose trip type

Step 2: Choose destination

Step 3: Choose tour guide

Step 4: Enter trip details

Step 5: Enter customer data and participant names

Step 6: Review summary and submit

Detailed flow:

1. Customer selects trip type
  - One Day
  - Rinjani
  - Custom
2. Customer selects destination
  - One Day: one destination
  - Rinjani: fixed Rinjani destination
  - Custom: multiple destinations
3. Customer selects guide
  - Guide is required
  - Guide does not add extra cost
4. Customer enters trip details
  - One Day: departure date + participant count
  - Rinjani: departure date + participant count
  - Custom: estimated duration + departure date + participant count
5. Customer enters contact data
  - Name
  - Phone
  - Email
  - Notes
  - Participant names based on participant count
6. Customer reviews summary
  - Destination
  - Guide
  - Dates
  - Duration
  - Participants
  - Total price or admin-confirmation message

---

## Database Design

### users

Stores customers and admins.

```
id
name
email
phone
password
role
email_verified_at
created_at
updated_at
```

## trip\_types

Stores available trip types.

```
id
name
slug
description
is_active
created_at
updated_at
```

Example data:

```
one-day
rinjani
custom
```

## categories

Stores destination categories.

```
id
name
slug
created_at
updated_at
```

Example data:

```
Mountain
Beach
Island
Culture
```

## destinations

Stores trip destinations and packages.

```
id
trip_type_id
category_id
name
slug
city
price
duration_days
duration_nights
description
status
image
is_active
created_at
updated_at
```

Notes:

- `price` is used for One Day and Rinjani trips.
- For Custom Trip destinations, `price` can be nullable or 0 if admin confirms later.

## destination\_highlights

Stores highlight cards for each destination.

```
id
destination_id
icon
title
subtitle
sort_order
created_at
updated_at
```

## destination\_itineraries

Stores itinerary days.

```
id
destination_id
day_number
title
sort_order
created_at
updated_at
```

## destination\_itinerary\_items

Stores activities inside each itinerary day.

```
id
destination_itinerary_id
time
activity
sort_order
created_at
updated_at
```

## guides

Stores tour guide profiles.

```
id
name
location
specialty
specialty_label
bio
avatar
cover_image
rating
review_count
trips_done
years_experience
languages
is_active
created_at
updated_at
```

Important:

- No guide price column is needed.
- Guide is included in the trip price.

## guide\_certifications

Stores guide certifications.

```
id
guide_id
name
created_at
updated_at
```

## guide\_destinations

Pivot table connecting guides and destinations.

```
guide_id
destination_id
```

## guide\_availabilities

Stores guide availability schedule.

```
id
guide_id
day
start_time
end_time
is_available
created_at
updated_at
```

## bookings

Stores booking requests.

```
id
user_id nullable
booking_code
trip_type_id
destination_id nullable
guide_id
start_date
end_date nullable
duration_days
participants_count
meeting_point
customer_name
customer_phone
customer_email
notes
status
estimated_total nullable
confirmed_total nullable
created_at
updated_at
```

Booking status examples:

```
pending
confirmed
cancelled
completed
```

## booking\_participants

Stores participant names.

```
id
booking_id
name
created_at
updated_at
```

## booking\_destinations

Used mainly for Custom Trip because one booking can have multiple destinations.

```
id
booking_id
destination_id
created_at
updated_at
```

For One Day and Rinjani, the main `destination_id` on `bookings` is enough.

For Custom Trip, use `booking_destinations`.

## testimonials

Stores public testimonials.

```
id
customer_name
customer_role
rating
message
avatar
is_active
created_at
updated_at
```

## gallery\_images

Stores gallery images shown on the frontend.

```
id
title
image
alt_text
sort_order
is_active
created_at
updated_at
```

# API Design

## Public APIs

```
GET /api/destinations
GET /api/destinations/{slug}
GET /api/guides
GET /api/guides/{id}
GET /api/testimonials
GET /api/gallery
POST /api/bookings
```

## Auth APIs

```
POST /api/register
POST /api/login
POST /api/logout
POST /api/otp/verify
GET /api/me
```

## Customer APIs

```
GET /api/profile
PUT /api/profile
GET /api/profile/bookings
GET /api/profile/bookings/{booking_code}
```

# Booking API Payload

## One Day Trip

```
{
  "trip_type": "one-day",
  "destination_id": 1,
  "guide_id": 2,
  "start_date": "2026-05-10",
  "participants_count": 2,
  "participant_names": ["Andi", "Budi"],
  "meeting_point": "Bandara Lombok International",
  "customer_name": "Andi",
  "customer_phone": "+62 812 3456 7890",
  "customer_email": "andi@email.com",
  "notes": "Tidak ada"
}
```

## Rinjani Trip

```
{
  "trip_type": "rinjani",
  "destination_id": 4,
  "guide_id": 1,
  "start_date": "2026-05-10",
  "participants_count": 3,
  "participant_names": ["Andi", "Budi", "Citra"],
  "meeting_point": "Sembalun Lawang",
  "customer_name": "Andi",
  "customer_phone": "+62 812 3456 7890",
  "customer_email": "andi@email.com",
  "notes": "Butuh porter tambahan"
}
```

Backend should automatically set:

```
end_date = start_date + 2 days
duration_days = 3
```

## Custom Trip

```
{
  "trip_type": "custom",
  "destination_ids": [5, 6, 9],
  "guide_id": 3,
  "start_date": "2026-05-10",
  "duration_days": 4,
  "participants_count": 2,
  "participant_names": ["Andi", "Budi"],
  "meeting_point": "Hotel di Mataram",
  "customer_name": "Andi",
  "customer_phone": "+62 812 3456 7890",
  "customer_email": "andi@email.com",
  "notes": "Ingin itinerary santai"
}
```

## Filament Admin Resources

Create these Filament resources:

```
DestinationResource
GuideResource
BookingResource
UserResource
TripTypeResource
CategoryResource
TestimonialResource
GalleryImageResource
```

### BookingResource

Admin should be able to:

- View booking details
- See customer contact
- See participant names
- See selected destination(s)
- See selected guide
- Change booking status
- Add confirmed total for Custom Trip
- Add internal notes

## DestinationResource

Admin should be able to:

- Create/edit destinations
- Upload image
- Set city
- Set category
- Set trip type
- Set price
- Set duration
- Add highlights
- Add itinerary days and activities
- Activate/deactivate destination

## GuideResource

Admin should be able to:

- Create/edit guide profile
- Upload avatar and cover image
- Set specialty
- Set languages
- Add certifications
- Connect guide to destinations
- Manage availability
- Activate/deactivate guide

---

## Frontend Component Plan

Convert the current HTML into components.

Suggested components:

```
Layout
Navbar
MobileDrawer
BottomNav
Footer
Toast

HomeHero
DestinationCard
DestinationModal
CatalogFilters
TripTypeTabs

BookingTripTypeSelector
BookingStepBar
BookingDestinationStep
BookingGuideStep
BookingDetailStep
BookingCustomerStep
BookingSummaryStep
ParticipantNameFields

GuideCard
GuideModal
ProfileTabs
AuthLayout
```

---

## Suggested Folder Structure

For Laravel + Inertia + React:

```
app/  
  Models/  
  Http/  
    Controllers/  
      Api/  
      Web/  
  Filament/  
    Resources/  
  
database/  
  migrations/  
  seeders/  
  
resources/  
  js/  
    Components/  
    Layouts/  
    Pages/  
      Home.jsx  
      Catalog.jsx  
      Booking.jsx  
      TourGuides.jsx  
      About.jsx  
      Profile.jsx  
  
routes/  
  web.php  
  api.php  
  
storage/  
  app/public/
```

For separate React frontend + Laravel API:

```
frontend/  
  src/  
    components/  
    pages/  
    services/  
    hooks/  
    styles/  
  
backend/  
  app/  
  database/  
  routes/  
  config/
```

## Implementation Roadmap

### Phase 1: Backend Foundation

1. Create Laravel project. 2. Configure PostgreSQL. 3. Create migrations. 4. Create models and relationships. 5. Seed sample destinations and guides from the current HTML data.

### Phase 2: Filament Admin

1. Install Filament. 2. Create admin user. 3. Create resources for destinations, guides, bookings, categories, trip types. 4. Add file upload for images. 5. Add booking status management.

### Phase 3: Frontend Conversion

1. Break the HTML into reusable components. 2. Rebuild the pages using frontend framework. 3. Replace hardcoded arrays with API calls. 4. Keep the current visual design as close as possible.

### Phase 4: Booking Integration

1. Submit booking form to backend. 2. Store booking in PostgreSQL. 3. Store participant names. 4. Store custom trip destinations. 5. Return booking code after successful submit.

### Phase 5: Customer Account

1. Add register/login. 2. Add profile page. 3. Add booking history. 4. Add OTP later if needed.

### Phase 6: Notifications

1. Email admin after new booking. 2. Email customer booking confirmation. 3. Add WhatsApp notification integration later.

---

## Important Notes

- Do not store guide pricing.
- Guide is included in the trip price.
- Rinjani is fixed to 3 days 2 nights unless the business later supports more packages.
- Custom Trip pricing should be confirmed manually by admin.
- Participant names should be stored separately in `booking_participants`.
- Custom Trip destinations should be stored in `booking_destinations`.
